**Patient information:**

Iron Infusion is a safe and effective method of replenishing iron stores. It can be now be given over 15 minutes at one of our Day Surgery Centres. After the infusion, you can drive home or return to work as no sedation is required.

Apart from immediately boosting iron stores to help the body produce more red cells, an iron infusion also avoids the very common side effect of oral iron (constipation). Iron infusion is also very useful in the following clinical situations:

- Women who are planning pregnancy - much safer before becoming pregnant.
- Post delivery mothers (breast feeding is safe after iron infusion)
- Women who have heavy menstruation cycles
- Women who are in the peri-menopausal age with heavy cycles
- People with iron mal-absorption conditions such as Coeliac Disease, Crohn's Disease or Ulcerative Colitis
- People with borderline iron stores but have significant symptoms associated with iron deficiency including lethargy, severe frequent headaches

For further information, please contact our office, and one of the friendly receptionists will assist with your enquiries.
